ABSTRAK

Sikap masyarakat merupakan peran yang paling utama untuk mencegah dan memutus mata rantai penularan penyakit Demam Berdarah *Dengue* dengan cara memusnahkan jentik/larva Demam Berdarah *Dengue* dengan melakukan kegiatan pemberantasan sarang nyamuk melalui 3M Plus. Tujuan penelitian ini adalah untuk mengetahui hubungan peran kader juru pemantau jentik dengan sikap masyarakat dalam pemberantasan sarang nyamuk di Wilayah Kerja Puskesmas Losari.

Metode penelitian dalam penelitian ini menggunakan survei analitik dengan pendekatan cross sectional. Populasi yaitu kepala keluarga di Desa Panggangsari Wilayah Kerja Puskesmas Losari sebanyak 171 kepala keluarga. Sampel pada penelitian ini menggunakan simple random sampling sebanyak 119 responden. Instrumen yang digunakan dalam penelitian ini adalah lembar kuisisioner.

Hasil penelitian menunjukkan bahwa peran kader juru pemantau jentik sebagian besar berperan rendah sebanyak 76 responden (63,9%) adapun Sikap Masyarakat dalam Pemberantasan Sarang Nyamuk sebagian besar memiliki sikap positif sebanyak 42 responden (35,3%). Berdasarkan uji statistik untuk mengetahui hubungan antara dua variabel menggunakan *Chi-Square* didapatkan nilai *p value* 0,000 dengan demikian hasil menunjukkan adanya hubungan peran kader juru pemantau jentik dengan sikap masyarakat dalam pemberantasan sarang nyamuk. Peran kader juru pemantau jentik sangat penting dalam merubah sikap masyarakat dalam kegiatan pemberantasan sarang nyamuk sebagai upaya pencegahan penyakit Demam Berdarah *Dengue* dengan pemantauan jentik nyamuk *Aedes aegypti*.

ABSTRACT

Community attitude is the most important role to prevent and break the chain of transmission of Dengue Hemorrhagic Fever by destroying Dengue Hemorrhagic Fever larvae/larvae by carrying out activities to eradicate mosquito nests through 3M Plus. The purpose of this study was to determine the relationship between the role of larva monitoring cadres and community attitudes in eradicating mosquito nests in the Losari Health Center Work Area.

The research method in this study used an analytic survey with a cross sectional approach. The population, namely the heads of families in Panggangsari Village, is 171 heads of families. The sample in this study used simple random sampling of 119 respondents. The instrument used in this research is a questionnaire sheet.

*The results showed that the role of cadres as larva monitors was mostly low, as many as 76 respondents (63,9%). Community Attitudes in Eradicating Mosquito Nests mostly had a positive attitude, as many as 42 respondents (35,3%). Based on statistical tests to find out the relationship between the two variables using Chi-Square, a p value of 0.000 was obtained, thus the results showed that there was a relationship between the role of cadres of larva monitors and community attitudes in eradicating mosquito nests. The role of cadres of larva monitors is very important in changing people's attitudes towards eradicating mosquito nests as an effort to prevent Dengue Hemorrhagic Fever by monitoring *Aedes aegypti* mosquito larvae.*
